

What does lead-acid special-shaped battery mean

What is a lead acid battery?

The lead acid battery is traditionally the most commonly used battery for storing energy. It is already described extensively in Chapter 6 via the examples therein and briefly repeated here. A lead acid battery has current collectors consisting of lead. The anode consists only of this, whereas the anode needs to have a layer of lead oxide, PbO_2 .

What is a lead-acid battery?

Over a century and a half after its creation, it continues to be a widely used energy storage system due to its reliability and low cost. A lead-acid battery is composed of a series of cells, each of which includes two types of lead plates - one coated with lead dioxide and the other made of sponge lead - submerged in a sulfuric acid solution.

What is the electrolyte in a lead-acid battery?

The electrolyte in a lead-acid battery is sulfuric acid, which acts as a conductor for the flow of electrons between the lead plates. When the battery is charged, the sulfuric acid reacts with the lead plates to form lead sulfate and water.

What is the working principle of a lead-acid battery?

The working principle of a lead-acid battery is based on the chemical reaction between lead and sulfuric acid. During the discharge process, the lead and lead oxide plates in the battery react with the sulfuric acid electrolyte to produce lead sulfate and water. The chemical reaction can be represented as follows:

What are the different types of lead acid batteries?

There are two major types of lead-acid batteries: flooded batteries, which are the most common topology, and valve-regulated batteries, which are subject of extensive research and development [4,9]. Lead acid battery has a low cost (\$300-\$600/kWh), and a high reliability and efficiency (70-90%).

What is a sealed lead-acid battery?

They are also used in renewable energy systems, such as solar and wind power. Sealed lead-acid batteries, also known as valve-regulated lead-acid (VRLA) batteries, are maintenance-free and do not require regular topping up of electrolyte levels. They are sealed with a valve that allows the release of gases during charging and discharging.

To put it simply, lead-acid batteries generate electrical energy through a chemical reaction between lead and sulfuric acid. The battery contains two lead plates, one coated in lead dioxide and the other in pure lead, submerged in a solution of sulfuric acid.
